

Subject: Conceptual Designs

In a TASS article last month entitled, "World has no feasible project yet to liquidate nuclear waste", <http://www.itar-tass.com/eng/level2.html?NewsID=770725>, Yevgeny Velikhov of the Kurchatovsyk Institute noted that "out of 14 versions of liquidating nuclear waste in some countries, suggested by researchers now, only three can be examined dead serious and even in this case with a great share of doubt and in the most distant future".

Radioactive waste can be shipped to the sun by space freight ferries, to put into pits of the Antarctic ice cap and to place it into earth's crust at great depths so that it can melt in the plasma of the earth later."

It is telling that none of these options is amongst the conceptual designs being considered by the Nuclear Waste Management Organization irrespective of the fact that the latter solution was patented in Canada fifteen years ago and has been suppressed ever since with the result:

1. The Canadian government has abused its fiduciary responsibility. "It is the single most important thing that a government must do; guarantee the security of its people." Honourable A. Anne McLellan, Canada's Minister of Public Safety said on being sworn in.
2. The Achilles heel of the nuclear power industry goes unaddressed as does the West's dependence on Mid East oil.
3. The threats occasioned by global warming and excess weapons material lying poorly protect around the globe waiting for some terrorist or rogue nation to buy or steal goes unabated. James Lovelock has recently repeated his warning of a few years ago that nuclear power is the only viable means of addressing "Global Warming". He also stated there is no sensible reason why nuclear waste should not be eliminated in the Earth's subduction zones.
